LEO-House Frankfurt: powered by EIRICH

On July 19, 2012, the DekaBank published this information in a press release: "Topping-out ceremony at the large-scale building site on Theodor-Heuss-Allee in Frankfurt. Within nine months, Deka Immobilien has structurally completed the building project in Theodor-Heuss-Allee 2 in Frankfurt that unites the "Poseidon" ensemble of formerly three sections into a coherent office complex. Since November 2011, the rotunda located in the center of the ensemble was dismantled and has been replaced by a new 17-story building. It interlinks the existing building sections that, at the same time, have undergone comprehensive revitalization. The building costs for the owner, the Deka-Immobilien Europe open-ended public property fund, amount to around 100 million euros... In mid-2013, the ING-DiBa bank will move with around 2.000 jobs into the more than 40,000 square meters of leased space. The general project planner is the Frankfurt-based architectural office of schneider+schumacher. "By comprehensive energetic refurbishing, extension and modernization measures, the previously three solitary buildings are synthesized into one high-rise building in a new guise. The Closed Cavity Facade (CCF), so far unprecedented in Germany, allows natural ventilation and is combined with further innovative elements such as profiled textile concrete", says manager Till Schneider..."

The more than 10,000 up to 380 cm long facade panels of white, glass fiber reinforced high performance facing concrete are made by Hentschke in Bautzen.

Sophisticated mixing equipment is needed to produce fiber reinforced high performance concrete. This is why Hentschke-Bau chose EIRICH technology.

EIRICH mixing systems are the ideal choice for manufacturers of pre-fabricated elements, who are satisfied with nothing less than top-quality, uniform concrete.
